

AGENTIC DEVICE ORCHESTRATOR

AI-powered control for every device, every action, across your enterprise

The SecuriThings Agentic Device Orchestrator transforms how organizations manage and control enterprise IoT devices—enabling direct, automated, device-level action across any device, without the need for complex integrations or technical expertise.

Unlocking True Device-Level Control at Scale

Enterprise environments rely on thousands of connected devices—from cameras and access control systems to printers, building automation systems, and specialized equipment. Managing and remediating issues across this diverse ecosystem is complex, manual, and often incomplete.

The Agentic Device Orchestrator introduces a new paradigm: AI-powered orchestration that bridges the gap between identifying issues and executing real remediation—directly on the device.

KEY BENEFITS

Create any command on any device

Eliminate dependency on predefined integrations or APIs. Dynamically generate and execute commands across any IP-enabled device—no matter how complex or niche.

Eliminate technical barriers with AI

Empower any user—technical or not—to control devices using natural language. No scripting, coding, or API expertise required.

Close the remediation gap

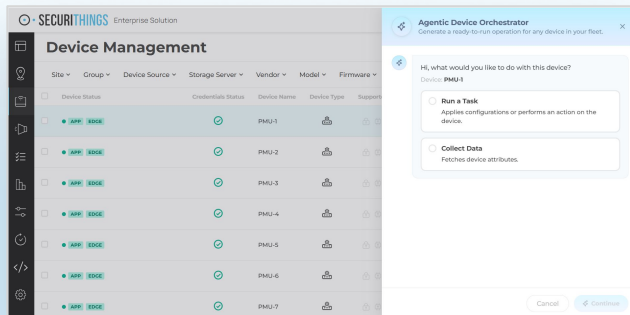

Move from identifying issues to fixing them instantly. Execute real actions at the device level to resolve vulnerabilities, operational issues, and compliance gaps.

Accelerate operations and reduce overhead

Automate complex workflows and eliminate manual troubleshooting, research, and scripting—freeing teams to focus on higher-value tasks.

Consolidate. Automate. Orchestrate

AI-powered agentic orchestration

Leverage intelligent AI agents that autonomously research device documentation, test commands, and generate the logic required to execute tasks—without human intervention.

Natural language command interface

Simply describe your objective (e.g., “restart offline devices” or “check storage capacity”), and the platform builds and executes the workflow automatically.

Dynamic command generation

Create custom actions in real time—without waiting for vendor APIs or prebuilt integrations.

Broad device compatibility

Integrate and control any IP-enabled device through a device-agnostic architecture, bringing all assets into a single management plane.

Automated remediation workflows

Execute device-level fixes such as reboots, configuration updates, firmware actions, and more—instantly and at scale.

Safe and secure AI usage

AI operates using publicly available device information and proprietary SecurIThings data—without using customer data—ensuring privacy and security.
